ROTOROPT 2.0

15/1/15

By Peter Baek, Conceptual Design

LM WIND
POWER

AGENDA

- 1. Integrated Design Challenge**
 - 2. Blade Design Components**
 - 3. RotorOpt 2.0**
 - 4. Design Example**
-

Wind Turbine Optimization

Turbine optimization objective:

- » Minimize cost of energy.

Simple, but

- » Each manufacturer has a different design philosophy, technology and suppliers.
- » Manufacturers use platforms with varying rotor and drive train configurations to bring down costs.

Wide range of possible designs

Blade optimization:

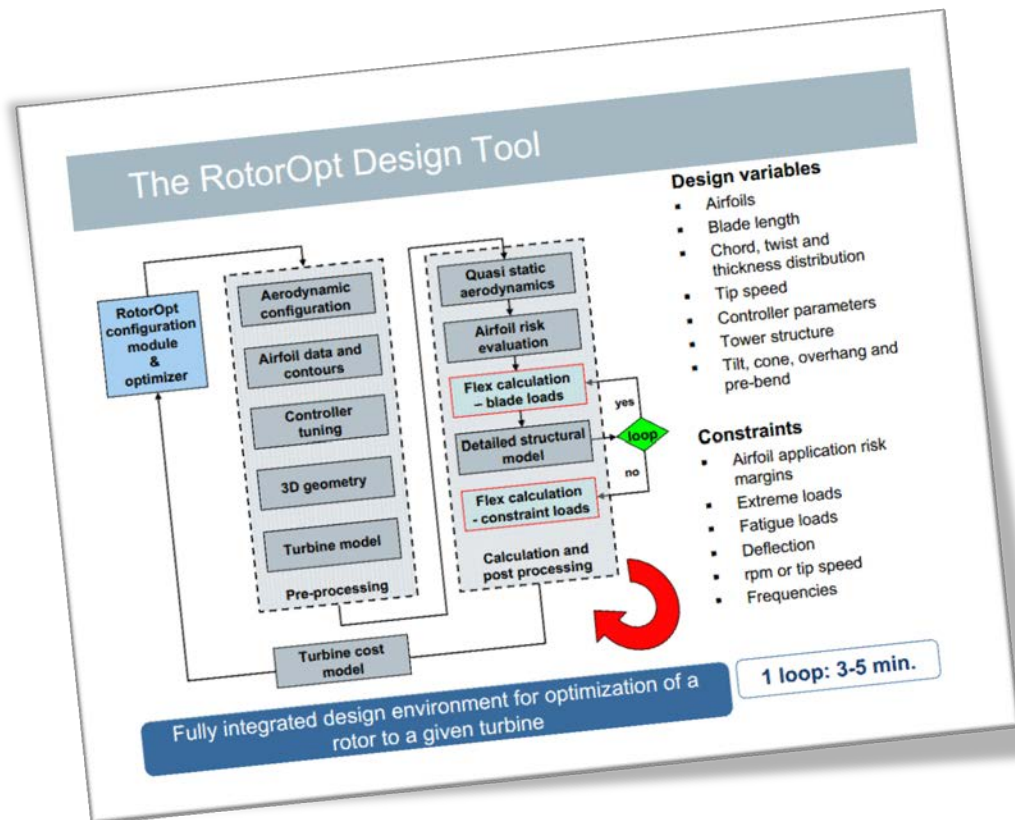

- » Maximize AEP within load envelope.
- » Minimize mass/moment for given AEP

Make the right compromises

RotorOpt 1.0 (2008)

First generation blade optimizer

- » Weak structural coupling
- » Few load cases
- » Serial perturbations
- » Desktop computer power

Main Blade Design Components

LM Material Database

- All validated materials available for production
- Including the Material Design Values (strength)
- Based on extensive testing.

LM Standard Laminate Plan

- Parametric, Scalable & “Optimizable”
- Ensures 80% production ready structural design
- Draws on 30+ years of experience
- Used directly by LM tools

LM Airfoil Families

- Holds all the latest validated airfoils (shapes & polars)
- All airfoils validated in LM Wind tunnel
- Different add-on concepts available (T-Spoiler, VG's, Serrations, etc)

Airfoil Blender

Smooth airfoil data from reliable source

- » Access to large database of measurements for LM-airfoils ($1.5 \cdot 10^6 < Re < 6 \cdot 10^6$) with addons (VGs, serrations, T-spoiler)
- » Arranged cleverly for the optimizer to be able transition smoothly from high to low lift airfoils

Load Calculation with LM-Flex

Standard IEC load cases

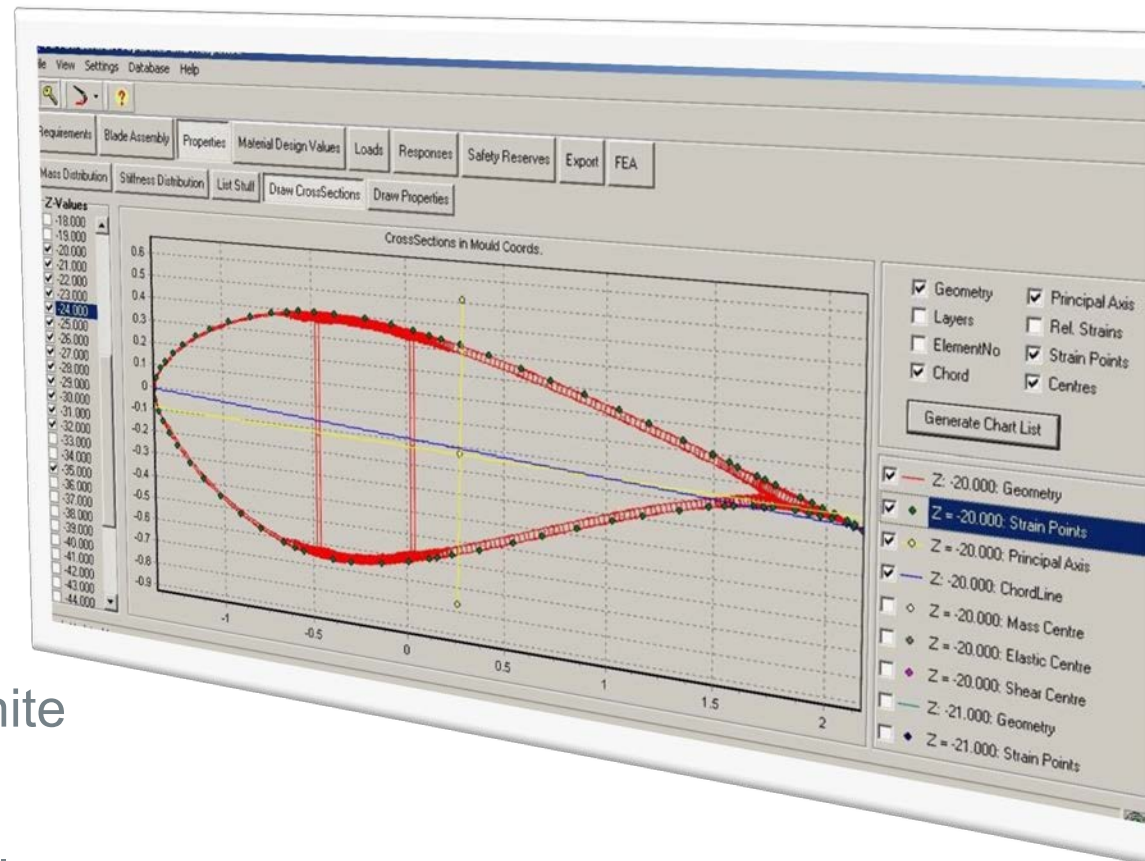

- » 20-100 IEC load cases (normal operation and extreme load cases) are simulated with LM-Flex (based on FLEX5)
- » LM-Flex can be swapped with Hawc2 for higher fidelity modelling – but 50-100x slower
- » Post processing using rain flow counting and extreme value extrapolation

Layup and Safety Evaluation

Structural Engineering

- » Layup using **”LM Standard Laminate Plan”**
- » Properties from **”LM Material Database”**
- » Cross section calculations with 2D finite element model
- » Evaluation of structural integrity due to fatigue and extreme loads (and buckling)

Setting the scene

Boundary Conditions

- ✓ Wind climate (e.g IEC 1A),
- ✓ Material (e.g. glass, carbon, hybrid),
- ✓ Turbine properties (height, cone, tilt, masses, ...)
- ✓ Turbine load envelope (fatigue and extreme)
- ✓ Turbine Controller Strategy (e.g. IPC, curtailment, ...)

Object Function. Pick one:

- AEP
- Mass or static moment
- Match blade

Design Variables

Distributions of:

- ✓ Chord,
- ✓ Twist,
- ✓ Relative thickness,
- ✓ Airfoil families,
- ✓ Airfoil addons (e.g. VGs),
- ✓ Blade centerline (x & y),
- ✓ Ply groups.

Scalars

- ✓ Blade length,
- ✓ Rotation Speed

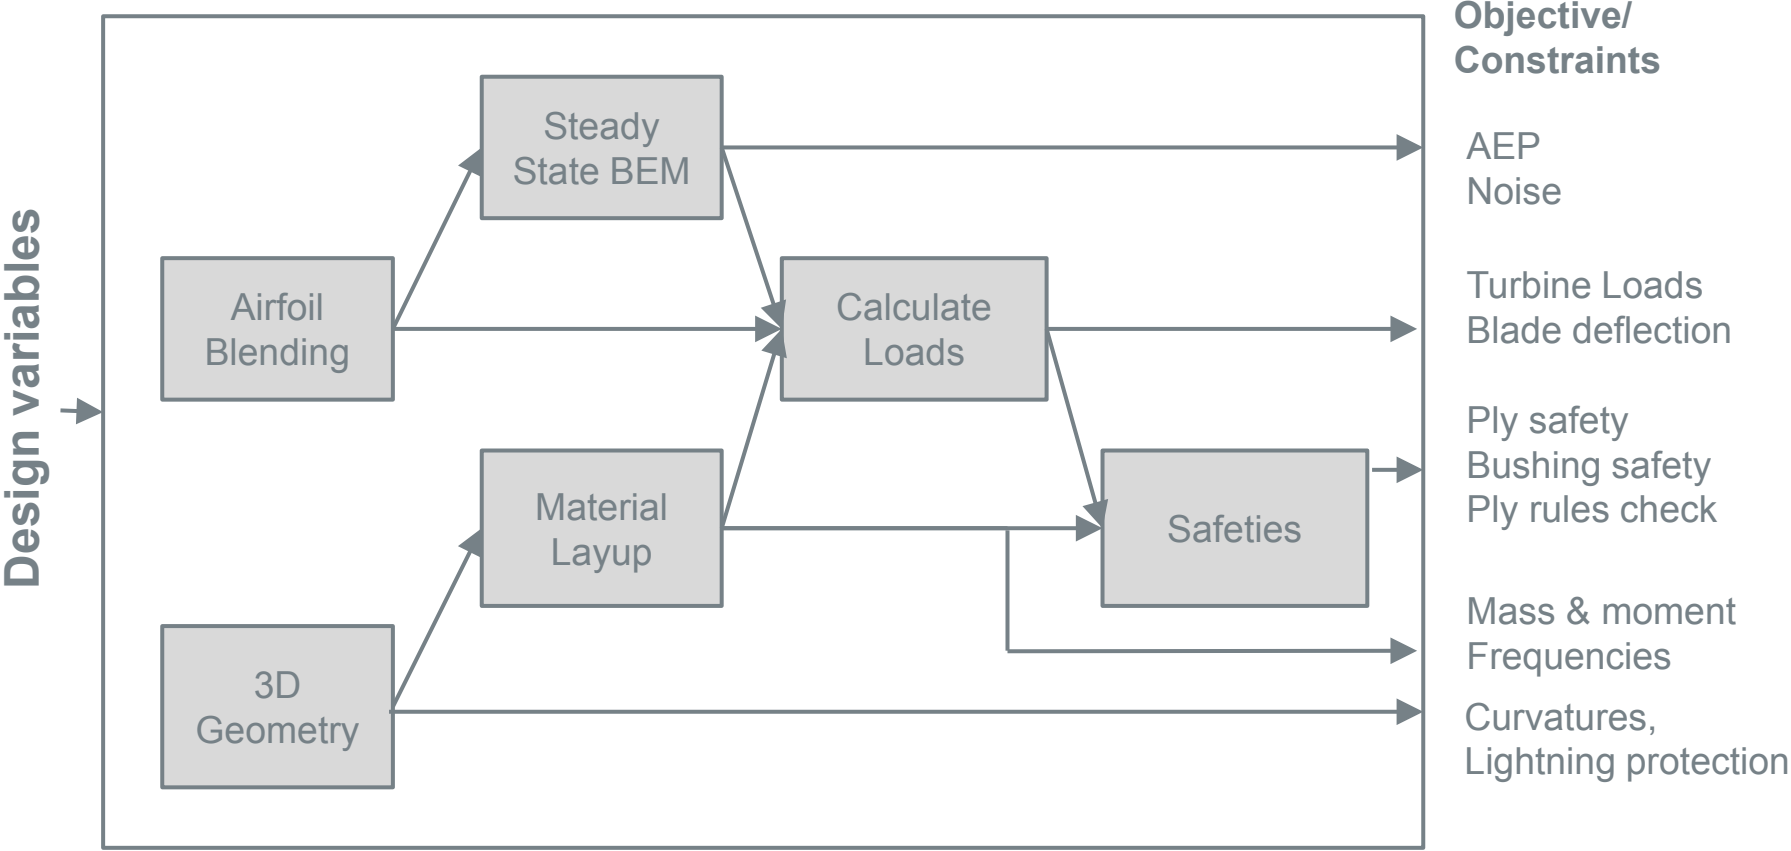

Constraints

- ✓ Maximum loads,
- ✓ Tip-to-tower clearance
- ✓ Minimum AEP,
- ✓ Maximum mass/moment,
- ✓ Minimum structural safety (plys, glue, bushings, etc.),
- ✓ Layup rules (e.g. tapering constraints),
- ✓ Minimum aerodynamic safeties,
- ✓ Maximum sound emission,
- ✓ Blade frequencies,
- ✓ Geometric constraints (lightning protection, maximum curvatures)

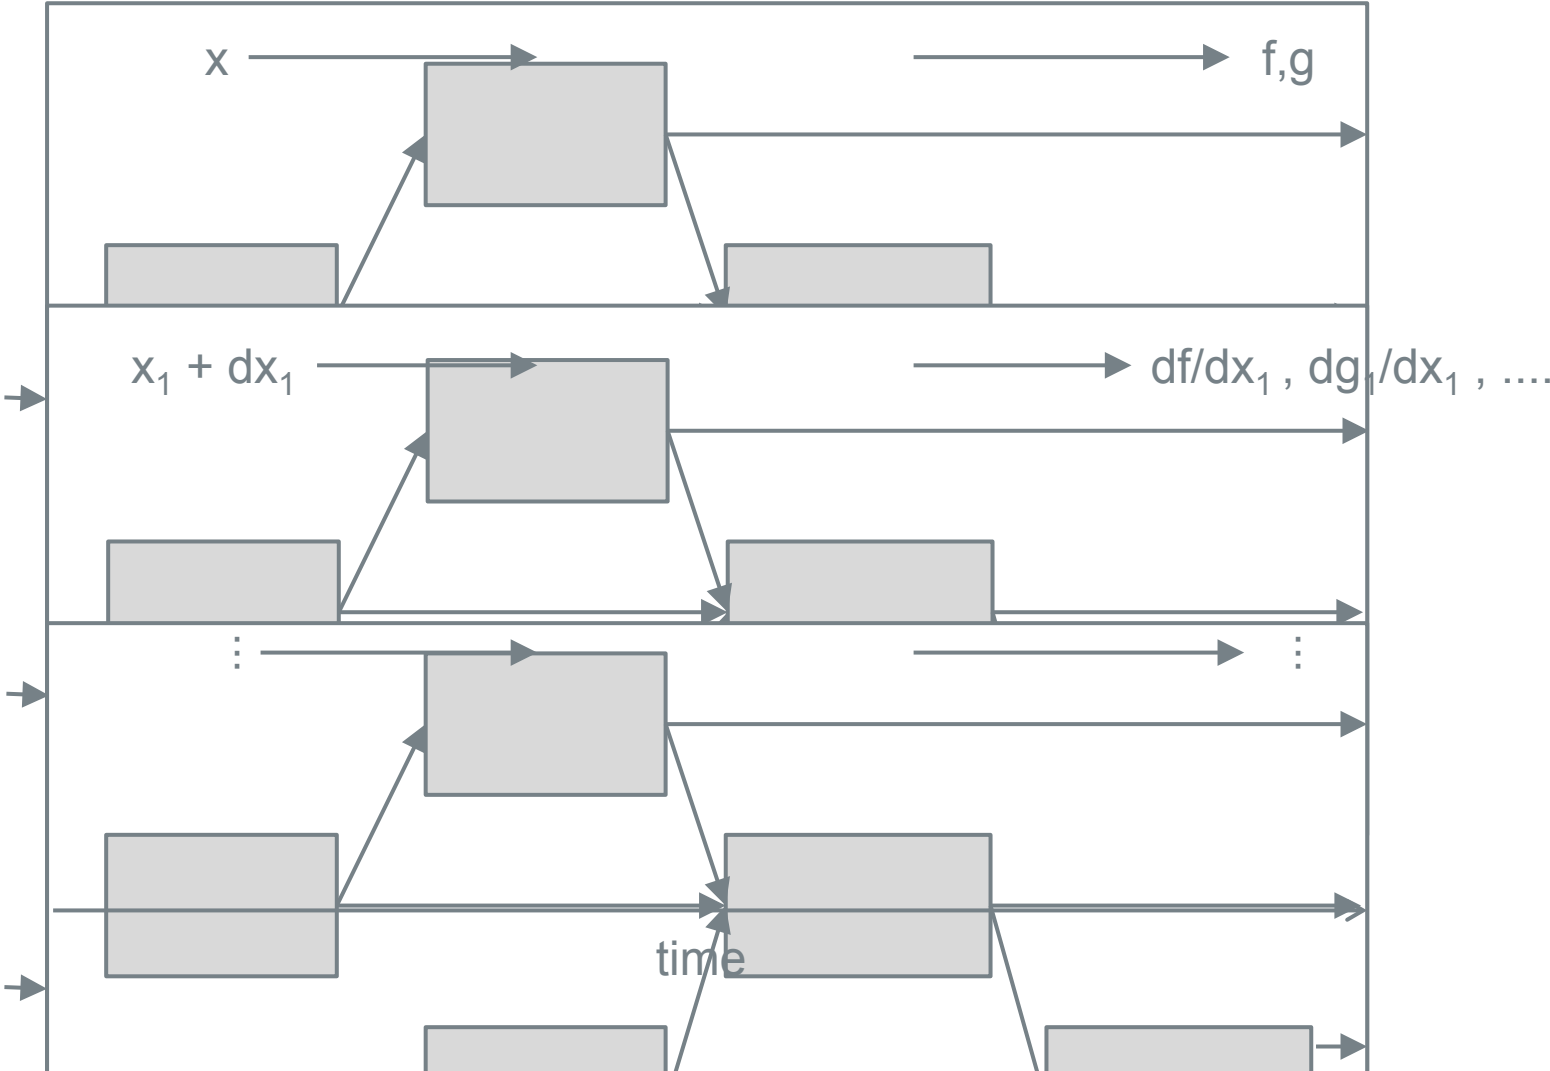

One Design Evaluation

Parallel Tasks in one Evaluation

Many parallel evaluations

Inhouse HPC Cluster

Hardware

- ✓ 48 nodes (8 cores each)
- ✓ InfiniBand network
- ✓ Scalable

Software

- ✓ Linux operating system
- ✓ Sun Grid Engine
- ✓ Python

LM101

Conceptual Design Demonstrator

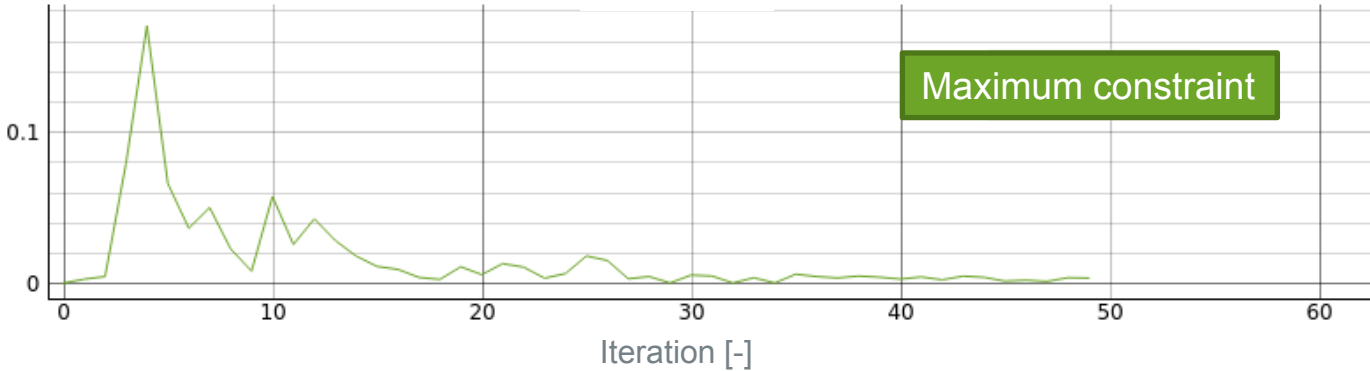

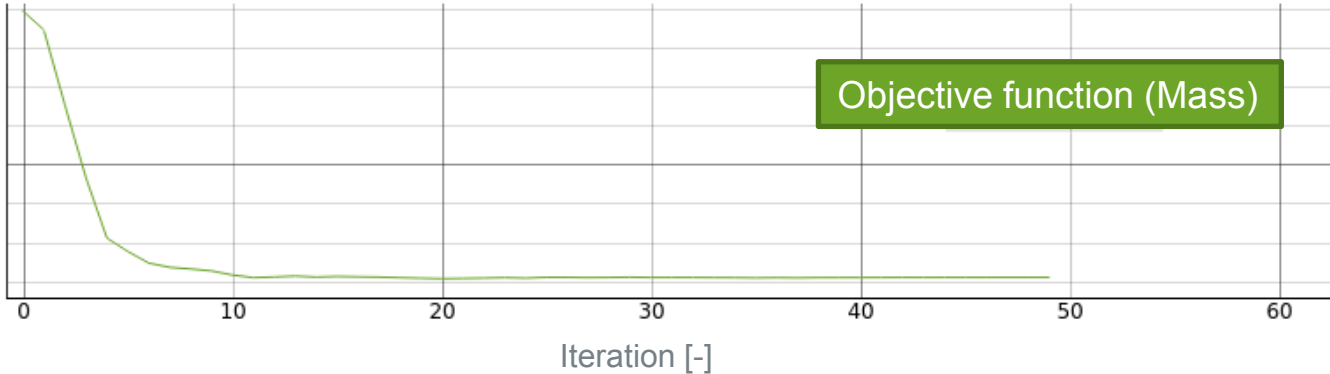

LM101

Conceptual Design Demonstrator

- » 101m Blade length
- » 101m/s Tip speed
- » 10.1 MW Rated power
- » Wind Class IEC 1A
- » Carbon fiber technology
- » Collective Pitch Control,
Variable Speed

Convergence History

Convergence History

	Red	Green
Objective	Max AEP	Min mass
Constraint	...	-2% AEP

□ Design Variables
 ✕ Blade Definition

Convergence History

	Red	Green
Objective	Max AEP	Min mass
Constraint	...	-2% AEP

- Design Variables
- ⊗ Blade Definition

Mass vs. Annual Energy Production

Next steps

Faster, better accuracy, bigger

- » Faster with frequency domain load calculations.
- » More precise with Hawc2 and FEM shell/solid model in the loop.
- » Tap into cloud computing resources

Conclusion

Rapid Design Process

- » There is no universal optimum blade geometry.
- » RotorOpt is a fast way to get the best compromise between structure and aerodynamics for the specific customer case
- » RotorOpt uses validated blade design components to minimize project risk with an almost production ready output

Thank you for your time
