Golden, CO

Energy for What's Ahead<sup>SM</sup>

# Outline

- Introduction
- Power Hardware-in-the-Loop (PHIL) Test Bed
- RSCAD Model and Scenarios
- Results
- Conclusions

# Introduction

Energy for What's Ahead<sup>SM</sup>

# SCE Activities and Need

- ❑ The Distributed Energy Resource (DER) technologies are emerging as one of the most prominent solutions for Southern California Edison (SCE) to augment California's Green House Gas (GHG) reduction goals.
- ❑ The adoption of such technologies in the existing grid is also encouraged by the California Public Utilities Commission (CPUC) through numerous avenues. Such as the Electric Program Investment Charge (EPIC) program.
- ❑ Rule 21 compliant Smart Inverter (SI), which is a mandatory requirement for the interconnection of inverter-based DER technologies.
- ❑ The installed Legacy Inverters (LIs) are capable of performing certain functions, but in sharp contrast, SIs offer unique and advanced control capabilities when integrated with DER technology.

# Aim of the Applied Research

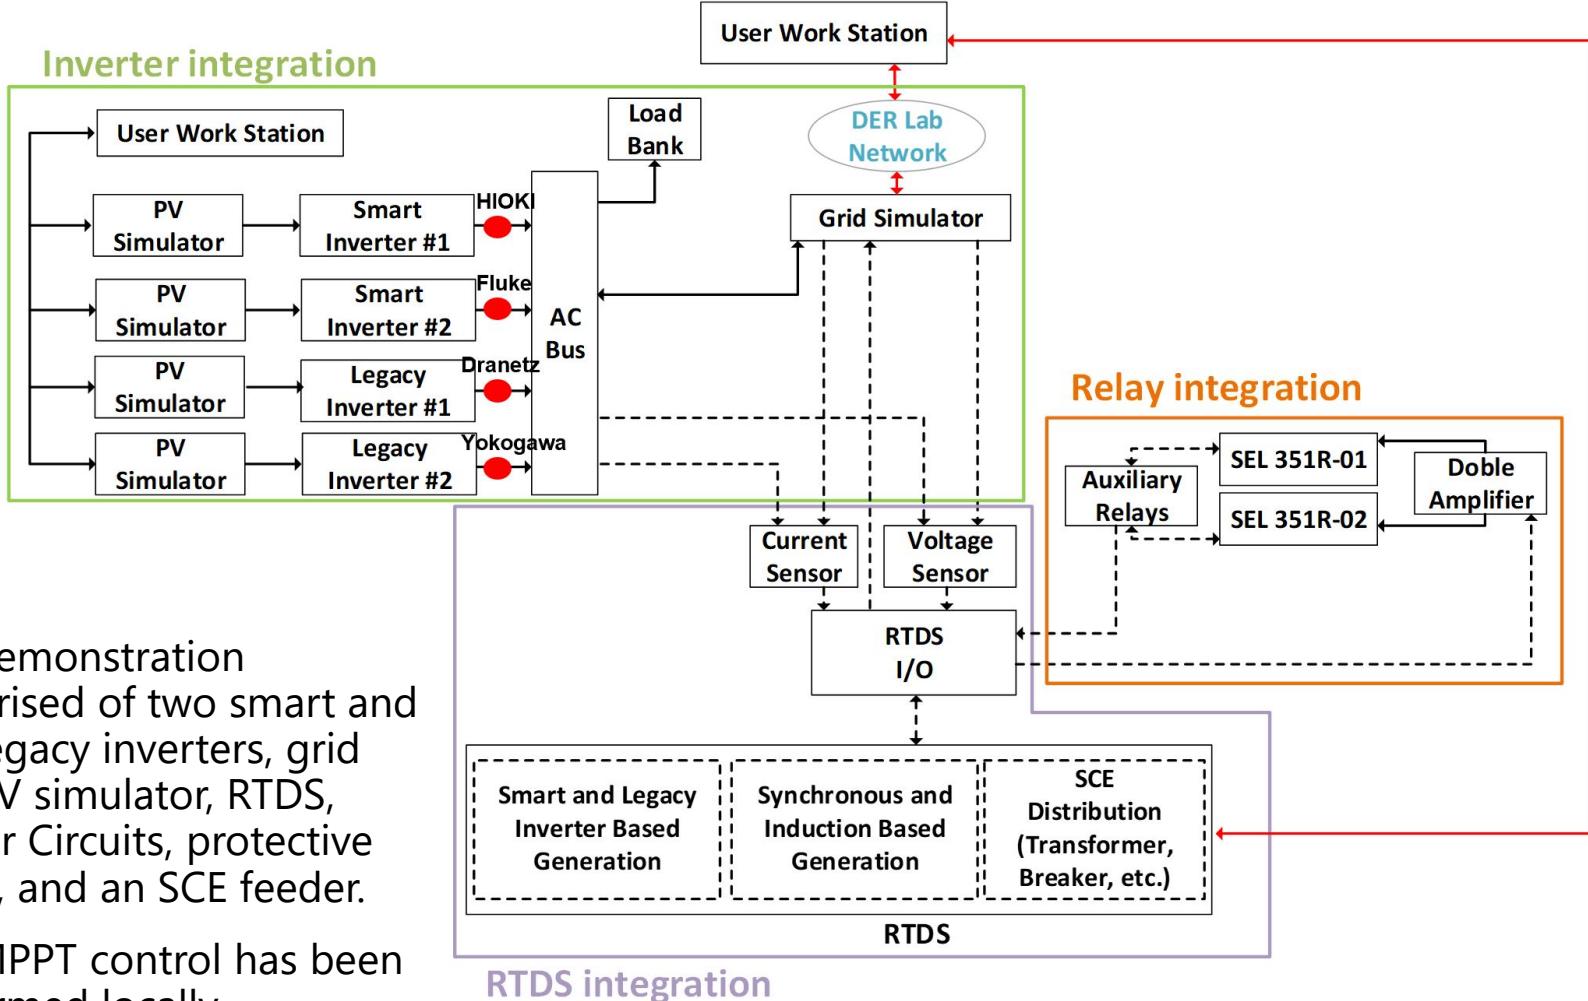

- ❑ An organizational, vendor-agnostic PHIL test bed to enhance the ease of DER into the SCE grid. The testbed can enable SCE, stakeholders, national labs, vendors, and university researchers to evaluate existing and future use cases in a test set that provides a realistic combination of multiple utility management systems and field equipment
- ❑ Verify the Rule 21 advanced functions for smart inverters
- ❑ Analyze results and determine what could be the potential impact on the feeder protection system

# Power Hardware-in-the-Loop (PHIL) Test Bed

Energy for What's Ahead<sup>SM</sup>

# PHIL Testbed Architecture

- ❑ The demonstration comprised of two smart and two legacy inverters, grid and PV simulator, RTDS, Sensor Circuits, protective relays, and an SCE feeder.
- ❑ The MPPT control has been performed locally

# RSCAD Model for Feeder

Notes:

1. 11 simulated PV models.
2. One Sync Gen. plus one Ind Gen.

# Different Scenarios For Volt/VAR use case

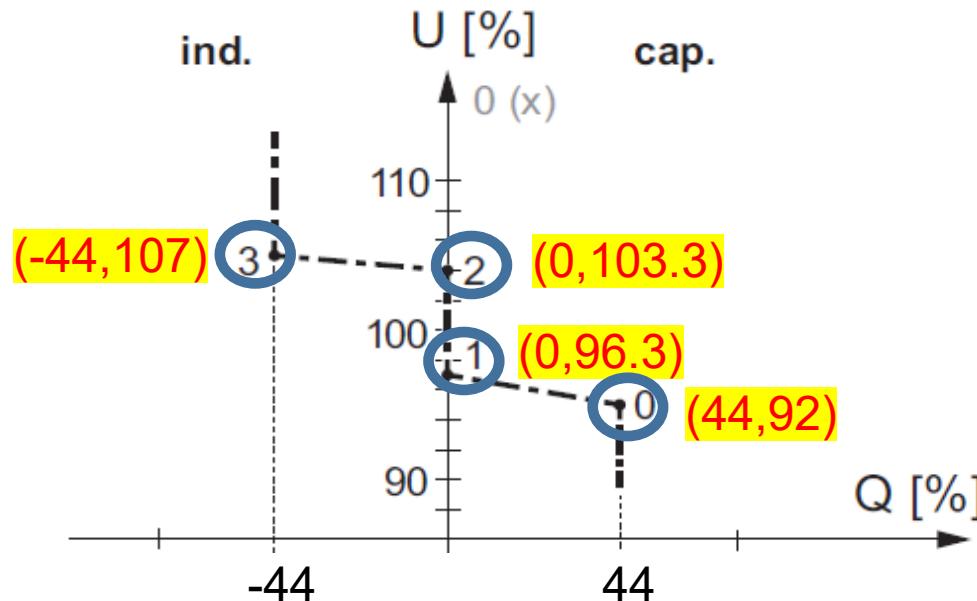

Scenario NO.	Inverter (Hardware) in the loop	Simulated DER type	DER penetration level	Event
I	1 Smart	<ul style="list-style-type: none"> <li>All PV inverters are <b>legacy</b></li> <li>Sync and induction generation units are <b>off</b></li> </ul>	60	Voltage variation
II	2 Smart	<ul style="list-style-type: none"> <li>All PV inverters are <b>legacy</b></li> <li>Sync and induction generation units are <b>off</b></li> </ul>	60	Voltage variation
III	2 Smart	<ul style="list-style-type: none"> <li>All PV inverters are <b>smart</b></li> <li>Sync and induction generation units are <b>off</b></li> </ul>	60	Voltage variation
IV	2 Smart	<ul style="list-style-type: none"> <li>All PV inverters are <b>smart</b></li> <li>Sync and induction generation units are <b>off</b></li> </ul>	120	Voltage variation
V	2 Smart 2 Legacy	<ul style="list-style-type: none"> <li>All PV inverters are <b>legacy</b></li> <li>Sync and induction generation units are <b>off</b></li> </ul>	60	Voltage variation
VI	2 Smart 2 Legacy	<ul style="list-style-type: none"> <li><b>66% smart inverters</b></li> <li><b>34% legacy inverters</b></li> <li>Sync and induction generation units <b>are off</b></li> </ul>	60	Voltage variation
VII	2 Smart 2 Legacy	<ul style="list-style-type: none"> <li><b>66% smart inverters</b></li> <li><b>34% legacy inverters</b></li> <li><b>Sync and induction generation units are off</b></li> </ul>	120	Voltage variation
VIII	2 Smart 2 Legacy	<ul style="list-style-type: none"> <li><b>66% smart inverters</b></li> <li><b>34% legacy inverters</b></li> <li>Sync and induction generation units <b>are on</b></li> </ul>	60	Voltage variation
IX	2 Smart 2 Legacy	<ul style="list-style-type: none"> <li><b>66% smart inverters</b></li> <li><b>34% legacy inverters</b></li> <li>Sync and induction generation units <b>are on</b></li> </ul>	120	Voltage variation

# Results

Energy for What's Ahead<sup>SM</sup>

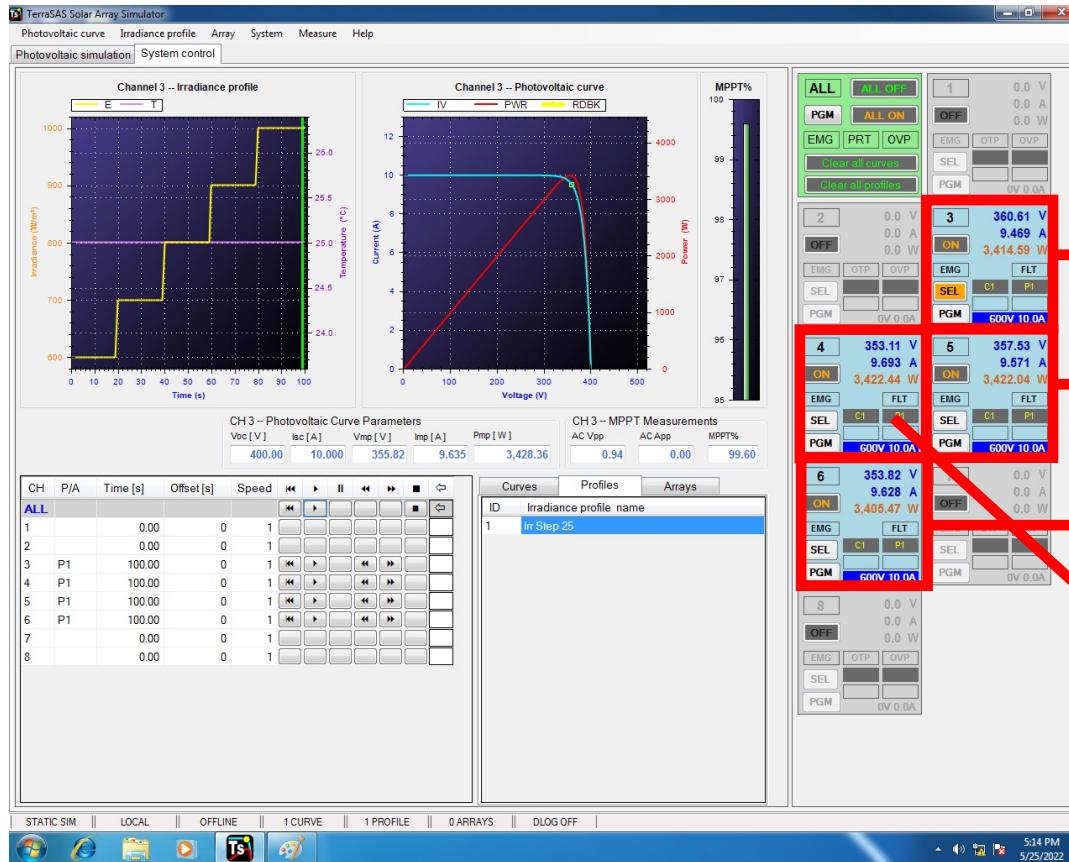

# Volt/VAR Curve of Smart Inverters for IEEE 1547-2018

✓ Verify this curve for smart inverters in Scenario VII

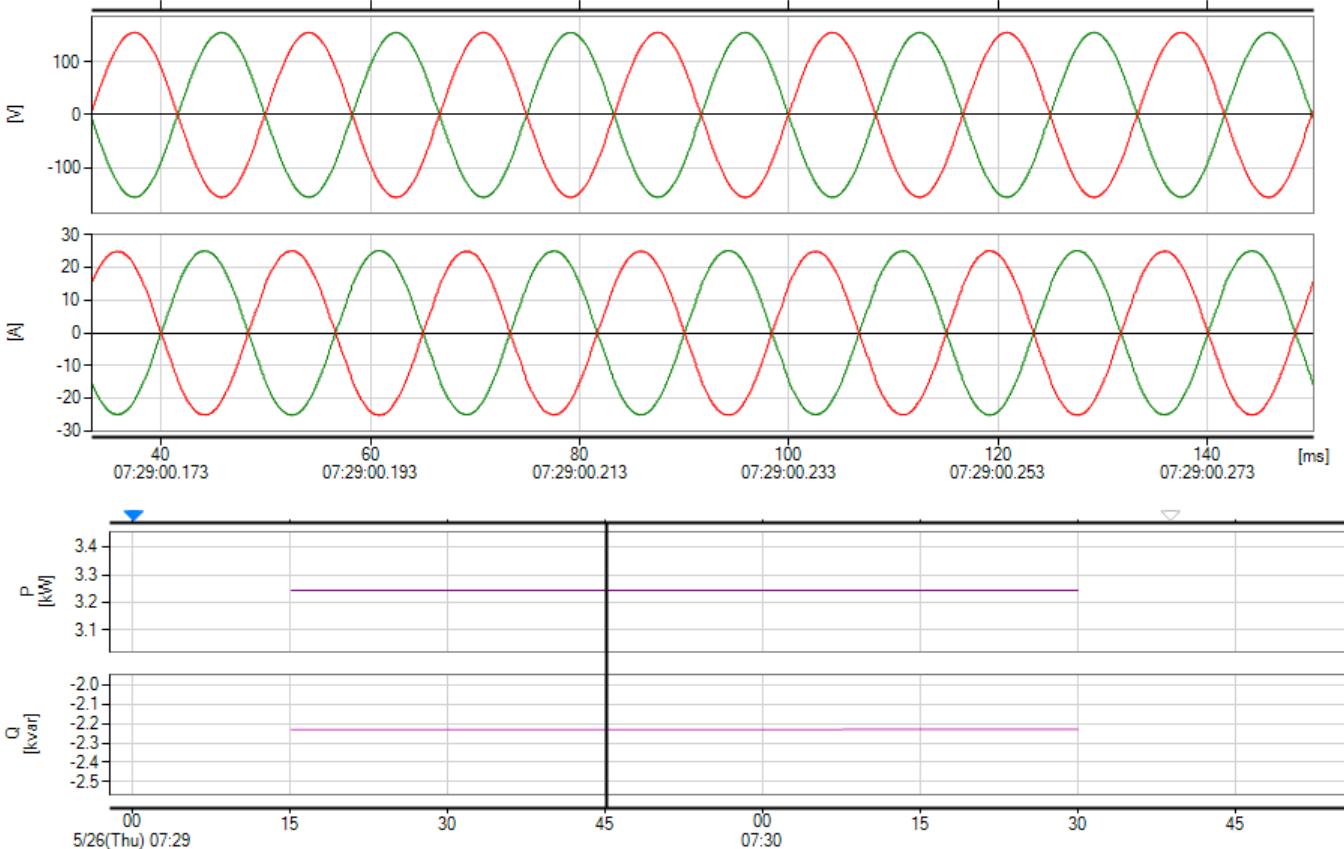

# Inverters DC Measurements for Operational Point #0 (+44,92)

- Running the RSCAD model and vary main source voltage to have **0.92 pu** voltage at PV.

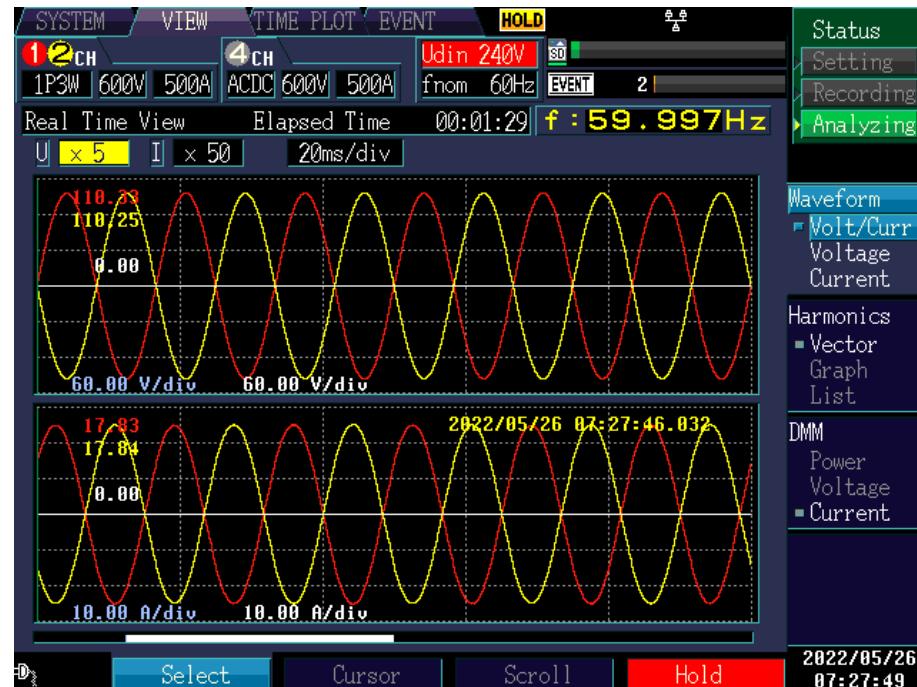

# Smart Inverter#1 Results for Operational Point #0 (+44,92)

- Running the RSCAD model and vary main source voltage to have **0.92 pu** voltage at PVHIL.

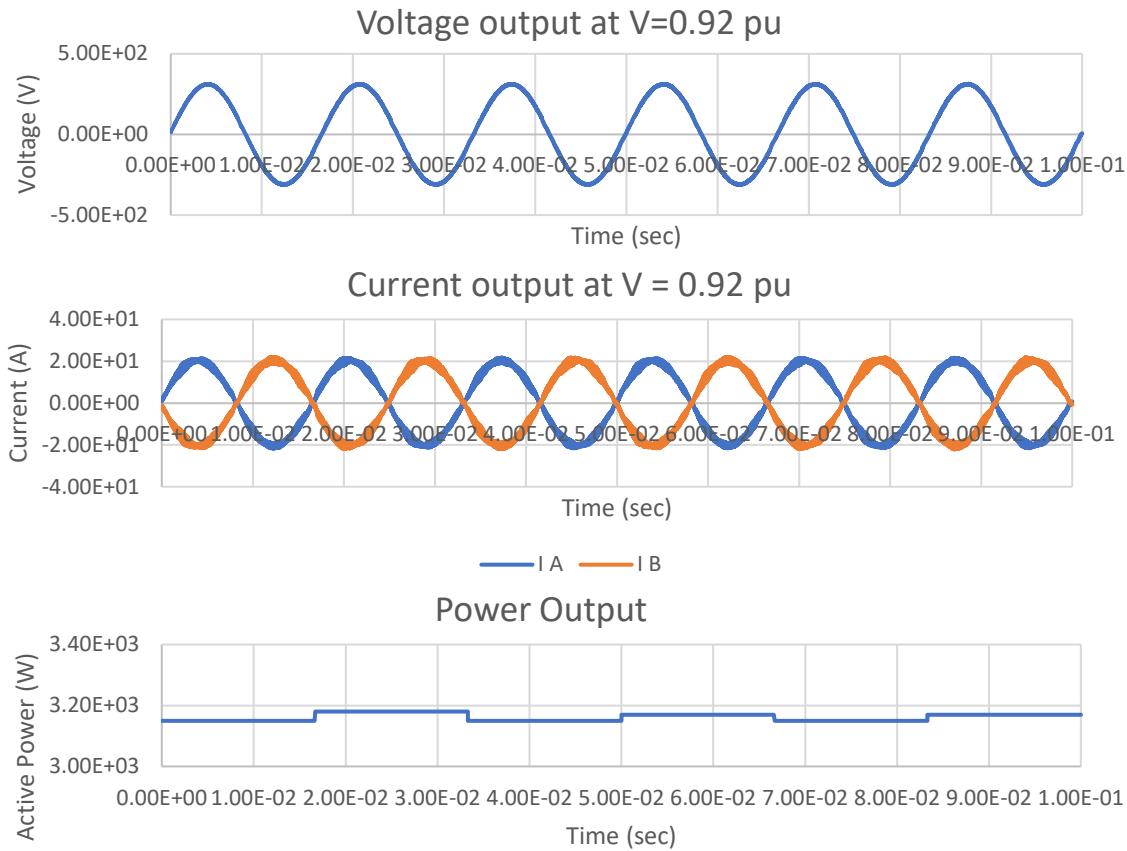

# Smart Inverter #1 Results for Operational Point #0 (+44,92)

- Running the RSCAD model and vary main source voltage to have 0.92 pu voltage at PVHIL.

# Legacy Inverter#1 Results for Operational Point #0 (+44,92)

- Running the RSCAD model and vary main source voltage to have **0.92 pu** voltage at PVHIL.

$V_{LL}$  rms = 219.24 V  
 $I_A$  rms = 14.44 A  
 $I_B$  rms = 14.48 A  
 $P$  = 3.16 kW

# Inverter #2 and #3 Results for Operational Point #0 (+44,92)

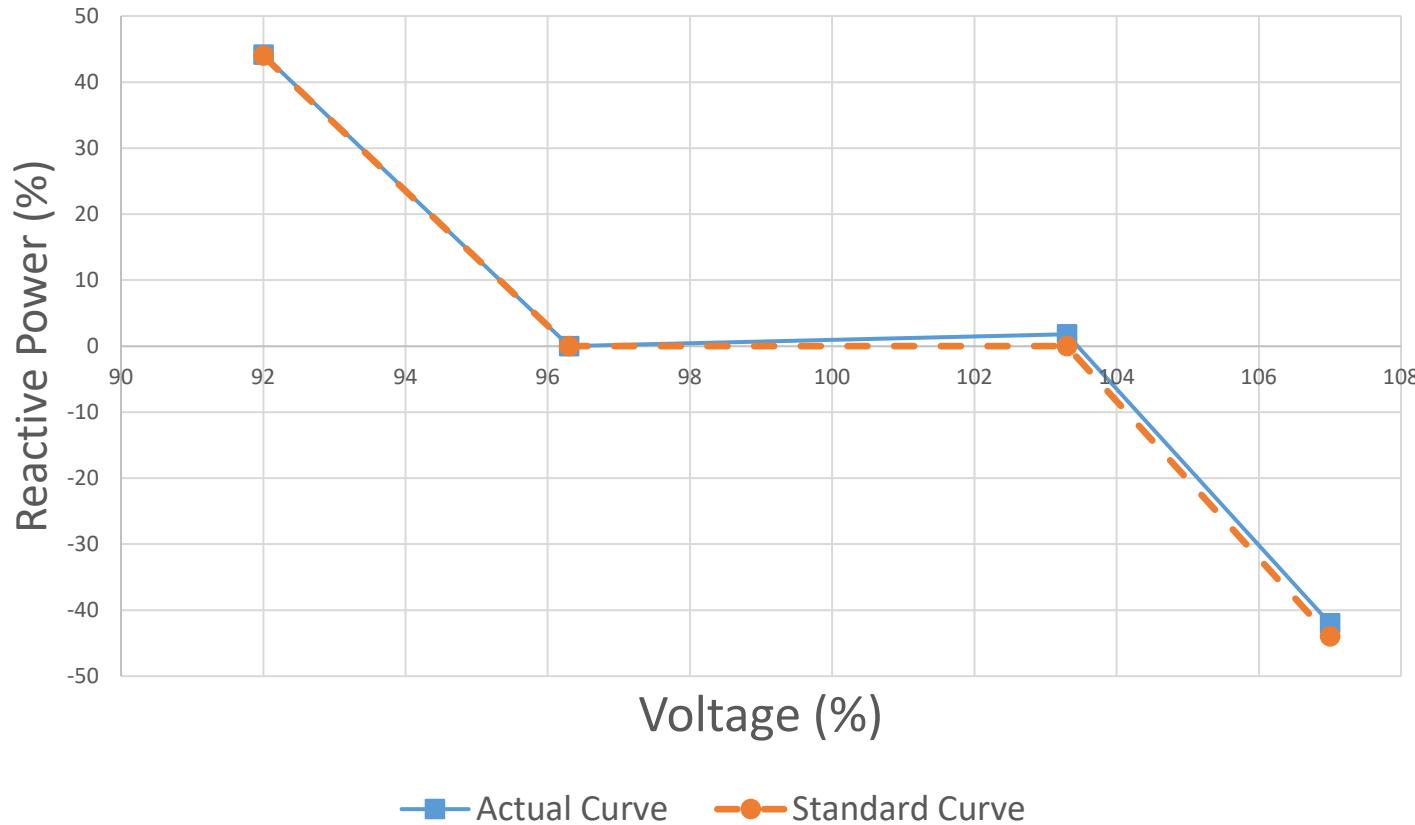

- Running the RSCAD model and vary main source voltage to have **0.92 pu** voltage at PHIL.

Measurement Parameters	#2 (Smart)	#3 (Legacy)
$V_A$	<b>110.3 V</b>	<b>110.3 V</b>
$V_B$	<b>110.2 V</b>	<b>110.2 V</b>
$I_A$	<b>17.75 A</b>	<b>14.41 A</b>
$I_B$	<b>18.04 A</b>	<b>14.45 A</b>
S	<b>3.94 KVA</b>	<b>3.16 KVA</b>
P	<b>3.28 kW</b>	<b>3.16 kW</b>
Q	<b>2.16 lead kVAR</b>	<b>0</b>

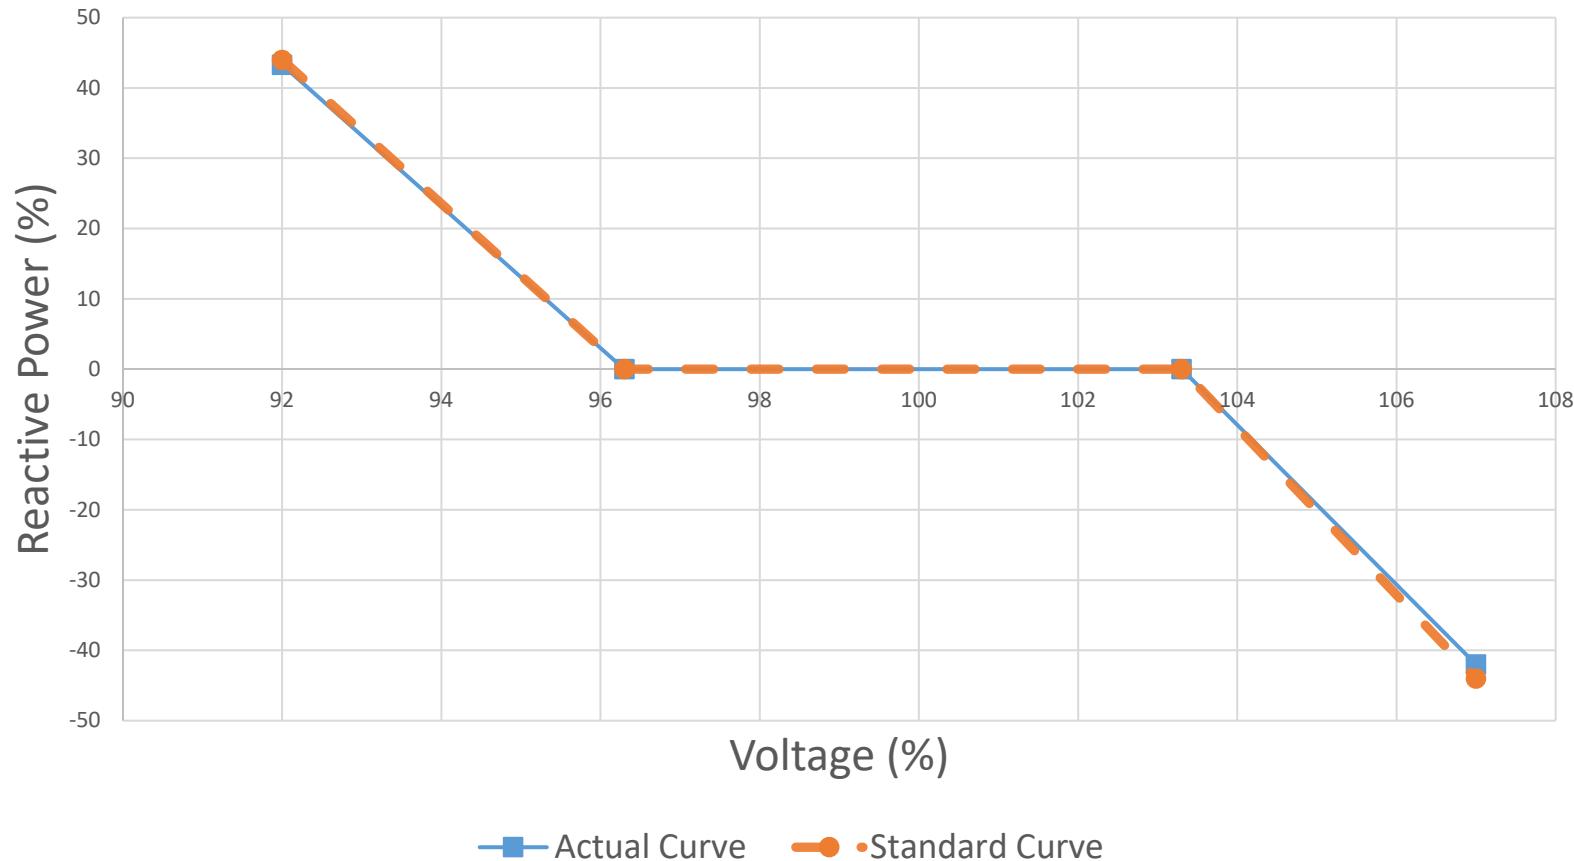

$$S_{\max} = 5000 \text{ KVA}$$
$$\mathbf{2.16 = 43.3\% S_{\max}}$$

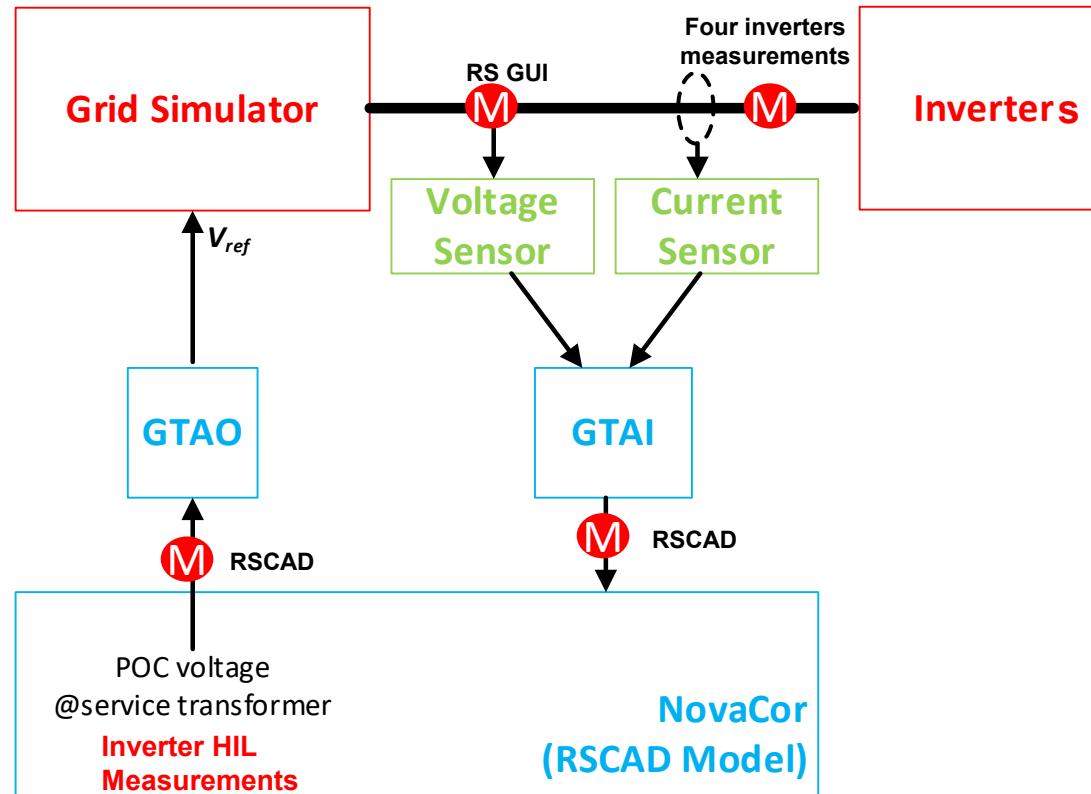

# Volt/VAR Curve of Smart Inverter#1

# Volt/VAR Curve of Smart Inverter#2

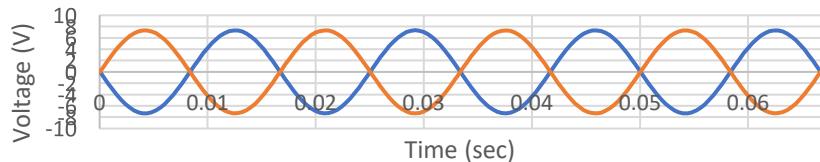

# Inverters Verification for Operational Point #0 (+44,92)

# RSCAD Results for Operational Point #0 (+44,92)

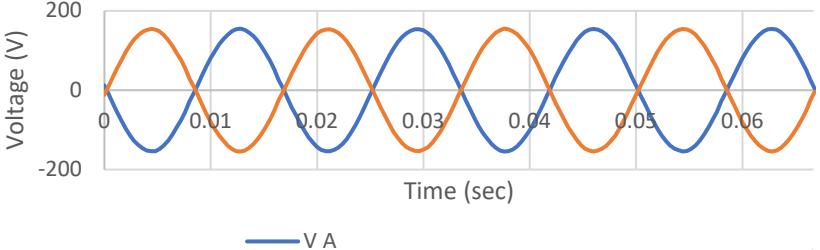

- Running the RSCAD model and vary main source voltage to have **0.92 pu** voltage at PVHIL.

GTAO Voltage/ Grid Simulator Input from RSCAD

$V_{A\_rms} = 5.186 \text{ V}$   $V_{B\_rms} = 5.181 \text{ V}$

GTAI Voltage/Volatge sensor output to RSCAD

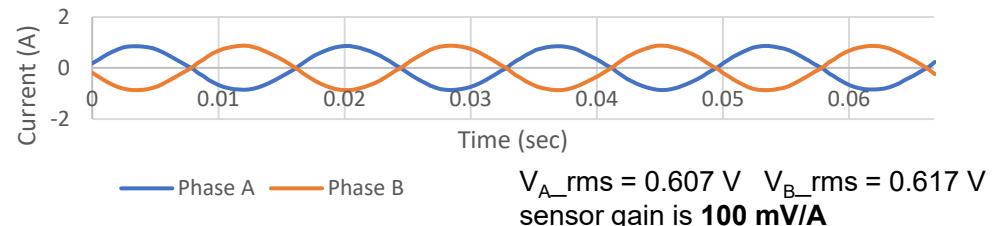

$V_A$

$$V_{A\_rms} = 5.186 * 21.2132 = 110.02 \text{ V}$$

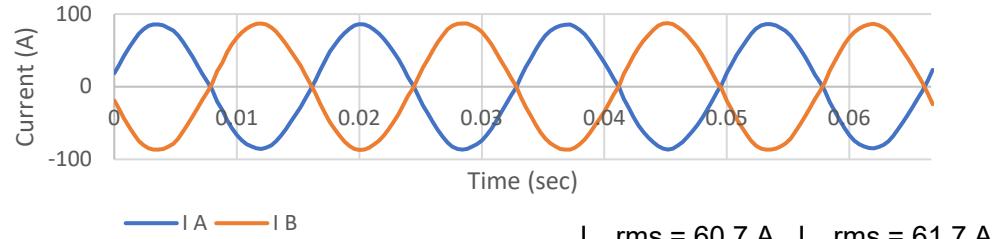

$$V_{B\_rms} = 5.181 * 21.2132 = 109.9 \text{ V}$$

GTAI Voltage/Current sensor output as input to RSCAD

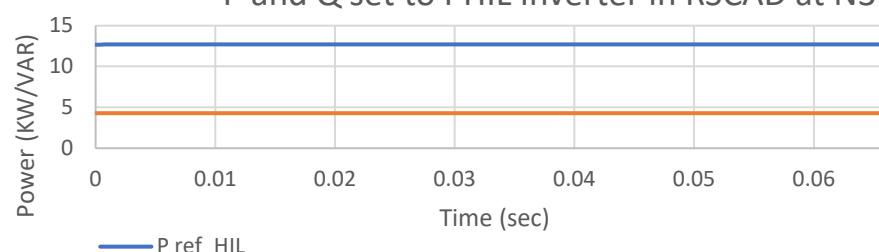

$V_{A\_rms} = 0.607 \text{ V}$   $V_{B\_rms} = 0.617 \text{ V}$   
sensor gain is **100 mV/A**

GTAI Actual Current to RSCAD

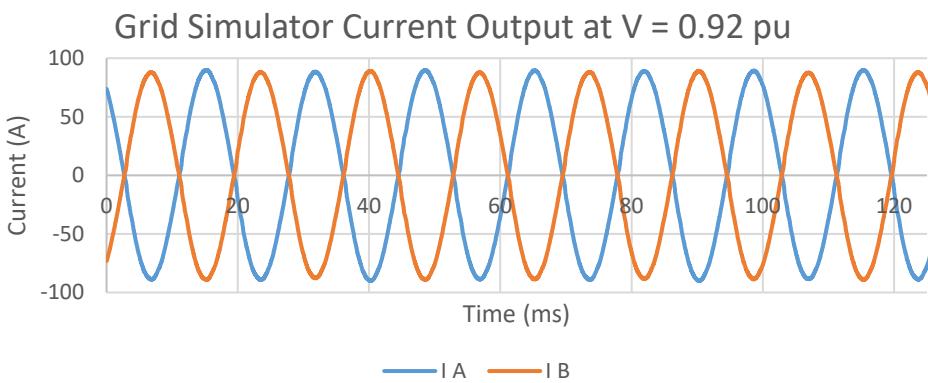

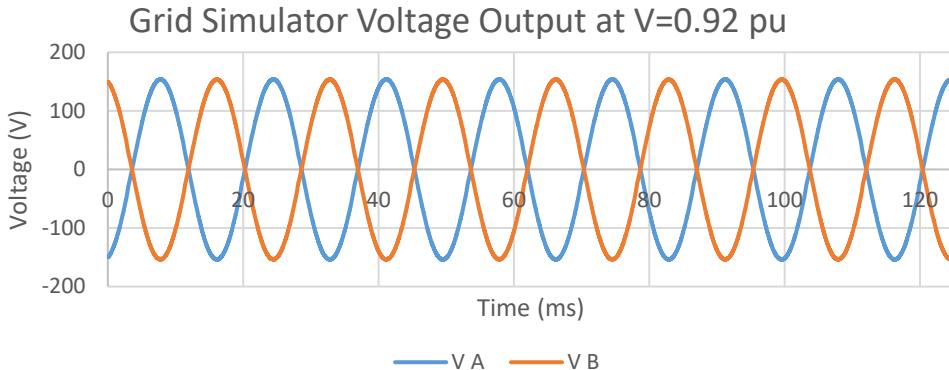

$I_{A\_rms} = 60.7 \text{ A}$   $I_{B\_rms} = 61.7 \text{ A}$

P and Q set to PHIL Inverter in RSCAD at N37

$P = 12.7 \text{ kW}$   $Q = +4.3 \text{ kVAR}$

# Conclusions

Energy for What's Ahead<sup>SM</sup>

- ❑ The development of a Power Hardware-in-the-Loop (PHIL) testbed at Southern California Edison (SCE)'s Distributed Energy Resource (DER) Laboratory is described
- ❑ The volt/var use case results are verified by experimentation and found that there would be no impact on the feeder protection given the current protection setting.
- ❑ This testbed can benefit SCE to study the emerging technologies without the need to conduct in-field trials
